Table S1: categories of gene expression pattern within the developing digit.

| Type | Gene | Early expression | Perturbation |
| :---: | :---: | :---: | :---: |
| Stripes | Gdf5 | (Merino et al., 1999; Storm \& Kingsley, 1999; Gao et al., 2009; Ray et al., 2015; Huang et al., 2016) | - Gdf5 beads embedded adjacent to nascent joints inhibits joint formation in chick (Merino et al., 1999) and mouse (Storm and Kingsley, 1999) <br> - Gdf5(---) mice show ectopic joint initiation (Storm and Kingsley, 1999) |
|  | Wnt9a | (Kan \& Tabin, 2013; Sohaskey et al., 2008) | - Retroviral mis-expression of Wnt9a in chick induces ectopic joint formation and downregulates chondrogenesis (Hartmann \& Tabin, 2001) |
|  | Wnt16 | (Kan \& Tabin, 2013) | - WNT/B-catenin signalling is necessary and sufficient to form joints (Guo et al., 2004) |
|  | PthrP | (Gao et al., 2009) |  |
|  | Chordin | (Kan \& Tabin, 2013) |  |
|  | cJun | (Kan \& Tabin, 2013) | - Cre mediated deletion of cJun from early mouse limb mesenchyme disrupts interzone formation and Wnt9a/Wnt16 interzone expression (Kan and Tabin, 2013) |
| Dots | pSMAD1/5/8 | (Huang et al., 2016) | - Activation of the BMP pathway inhibits joint formation (Brunet et al., 1998; Zou et al., 1997) - Inhibition of the BMP pathway expands joint progenitors (Yi et al. 2008) <br> - In chick, interdigital sources of BMP, both endogeneously present and exogeneously applied, affect joint patterning in nearby digits (Dahn and Fallon, 2000; Suzuki et al., 2008) |
|  | Ihh | (Gao et al., 2009) | - Loss of joints in Ihh(--) mice (Hilton et al. 2005) <br> - Partial rescue of joints in Ihh(--); Gli3 (---) double mutant mice <br> - Mouse Ihh E95K mutation, reducing capacity and range of hedgehog signalling, leads to loss of middle phalanx from digit V , and spreading of Gdf5 expression (Gao et al., 2009) |
|  | Ppr | (Gao et al., 2009) |  |
| Holes | Hip1 | (Gao et al., 2009) |  |
|  | Gli1 | (Gao et al., 2009) |  |

Table S2: Summary of model variables and parameters

| Category | Type | Description |
| :---: | :---: | :---: |
| Dot system | $A$ | Concentration of dot molecule |
|  | $S$ | Concentration of hole molecule |
|  | $D_{A}$ | Diffusivity of $A$ |
|  | $D_{S}$ | Diffusivity of $S$ |
|  | $k_{A}$ | Controls degradation and production of $A$ |
|  | $k_{S}$ | Controls degradation and production of $S$ |
|  | $h_{A}$ | Concentration-independent production of $A$ |
|  | $h_{S}$ | Concentration-independent production of $S$ |
|  | $k_{\text {deg }}$ | Degradation rate of $A$ outside domain |
| Stripe system | $B$ | Concentration of activating stripe molecule |
|  | $I$ | Concentration of inhibitory stripe molecule |
|  | $D_{B}$ | Diffusivity of $B$ |
|  | $D_{I}$ | Diffusivity of I |
|  | $h_{B}$ | Controls production of $B$ that is independent of $I$ |
|  | $k_{B}^{0}$ | Controls degradation and production of $B$ |
|  | $k_{I}$ | Controls degradation and production of $I$ |
|  | $\kappa_{B}^{0}$ | Controls the inhibitory effect of $A$ and $B$ on the production of $B$ |
| Geometry | $L_{0}$ | Initial digit length |
|  | $L$ | Final digit length |
|  | W | Digit width |
|  | $\epsilon$ | Semi-minor axis (half-width) of ellipses at digit ends |
|  | $T$ | Total simulation time |
|  | $T_{i}$ | Time to allow patterns to settle without growth |
|  | $L_{P}$ | Length of patterning region |

## Table S3: Simulation parameters

Unless otherwise stated, we kept the following parameters constant across all simulations:
$k_{A}=0.0025, k_{S}=0.003, k_{B}^{0}=0.01875, k_{I}=0.0375 h_{A}=0.00025, h_{S}=0.003, h_{B}=$ $0.00187, \kappa_{B}^{0}=0.2, k_{\text {deg }}=1 \times 10^{-5}, \epsilon=3, T_{i}=5 e 3, \delta t=20$

| Figure | $\boldsymbol{D}_{\boldsymbol{A}}$ | $D_{S}$ | $\boldsymbol{D}_{\boldsymbol{B}}$ | $D_{I}$ | $L_{0}$ | L | W | $T$ | other |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

A
dot-forming Turing system

B stripe-forming Turing system

## C

D

## Figure S1

(A) In the dot-forming system, dots (red) form in antiphase with holes (green).
(B) In the stripe-forming system, stripes (blue) form in-phase with other stripes (orange).
(C) Varying the degradation rate of $A$ outside the domain $\left(k_{d e g}\right)$ changes joint orientation. An intermediate value is required to get stereotypical joint morphology. (D) A more general model, involving mutual repression between the dot- and stripesystems, generates patterns that are qualitatively similar to the simpler model in Fig. 1.
(E,F) Schematic of parameters describing digit geometry and growth.

## A

## Patterning speed:

fast

medium

slow

## B

## Strength of boundary signals:

Figure $\mathbf{S 2}$
(A) Changing the speed of patterning modulates the precise location of newly forming joints. Left: fast patterning results in joints that divide the distal phalanx (arrowhead). Middle: slower patterning results in joint specification at the growing tip (asterisk). Right: if patterning is too slow, the system fails to self-organize.
(B) Modelling boundary effects can affect the precise location of newly forming joints. Left and Right: Both weak and strong boundary effects can cause joints to divide existing phalanges (arrowhead). Middle: intermediate boundary effects bias joints to form near the distal tip (asterisk).

A

close to dot centre

## B

C

comparison

Figure S3
(A) Simulating the stripe system for uniform values of $A$ and $S$, chosen to mimic being at different distances from a dot-centre in Fig. 4A.
(B) Simulating the stripe system for a one-dimensional gradient in the values of $A$ and $S$, again chosen to mimic being at different distances from a dot-centre in Fig. 4A.
(C) Direct comparison of simulated joint patterns with the voronoi tessellation of Fig.

4 A .

only $h$ depends on dots

C

both $h$ and a depend on dots

## Figure S4

(A) Simulation of the generic dot-stripe system (Equations 7-8) with $h$-coupling only generates holes.
(B) Simulation of the generic dot-stripe system (Equations 7-8) with a-coupling only generates misoriented stripes.
(C) Simulation of the generic dot-stripe system (Equations 7-8) with both $h$ - and $a$ coupling generates a polygonal lattice of joints.
