

Cover: Confocal image of a horizontal section through a wild-type adult *Drosophila* eye, stained for Retinol dehydrogenase B (RdhB, green), N-cadherin (red) and Rhodopsin 1 (Rh1, blue). The image shows the curved external surfaces of the corneal lenses and their attachments to the secondary and tertiary pigment cells stained for RdhB, as well as the rhabdomeres stained for Rh1 that extend through the full depth of the retina. See Research article by Wang et al. (dev200217).
