

Figure S7

**Figure S7: Imaginal disc growth is delayed by developmental ethanol exposure.** Wing imaginal discs showing *decapentaplegic* (*dpp-lacZ*) expression from control larvae staged at (A) 72h after egg deposition (AED), (B) 96h AED and (C) 120h AED. Wing imaginal discs with *dpp-lacZ* expression from 5% ethanol-reared larvae staged at (D) 120h AED and (E) 144h AED. Wing imaginal discs from control and ethanol-reared larvae were dissected the earliest developmental stage possible, at 72h AED and 120h AED, respectively.
