

Figure S2. H&E staining of cross-section of lower jaw incisors from 7 week old transgenic mice. Normal pulp cavity is seen in lower jaw from F1-line VF1-07, tetop-LA^{G608G}; K5tTA⁻ mice (A). Foreign material (FM) equivalent to cellulose from cage bedding and mouse chow, was found intra pulpally in bitransgenic mice of the same F1-line (B). Intercross breeding pairs were supplied with doxycycline until day of birth of litter. Scale bars: 100 μ m.
