

Fig. S4. Different effects of the β_3 -GFP-IPP chimera deletion mutants on the formation of tensin-rich adhesions in PINCH1-null or ILK-null backgrounds. Representative images of PINCH1T^{-/-} cells (A) and ILKT^{-/-} cells (B) expressing each β_3 -GFP-IPP chimera deletion mutant. Cells were fixed 4 hours after plating on uncoated coverslips. Bars = 20 μ m.
