

Fig. S1. Evaporative cooling capacity (EHL/MHP) as a function of air temperature in Lesser Goldfinch, House Finch, Pyrrhuloxia, Cactus Wren, Northern Cardinal, Abert's Towhee, and Curve-billed Thrasher. EHL/MHP was regressed against T_{air} above 36°C (all $P < 0.001$). The solid circles represent more active birds (activity score = 2) and are included in all regressions and parameter estimates. See text for statistical details of linear regressions and Table S3 for parameter estimates.

Table S1. Slope (m) and intercept (b) for the relationship of mass independent residuals of resting metabolic rate (RMRr) and evaporative water loss rate (EWLr) in response to air temperature above the upper critical temperature (T_{uc} , determined from RMRr) in 7 species of Sonoran Desert passerine birds.
