

Figure S1. The relationship between the index and actual measurement of lifetime fecundity recorded from 20 male-female pairs of *D. melanogaster*. Regression line is fitted to indicate that there was a highly positive linear association between the two variables.

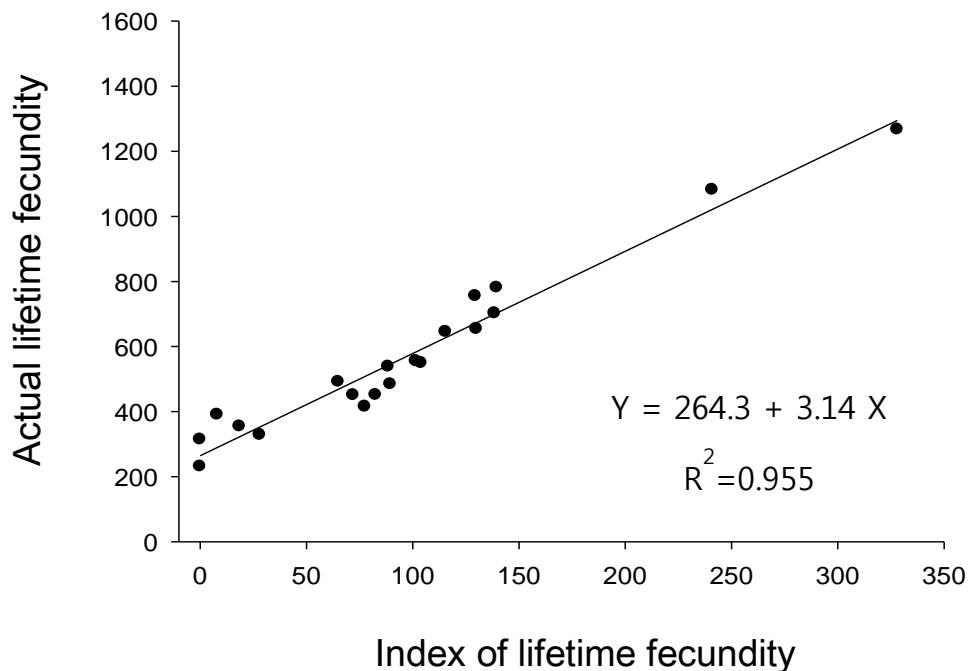

Figure S2. Thin plate spline response surface plotted for the body mass of newly eclosed male *D. melanogaster* expressed across 34 chemically defined diets. The highest values of the trait are given dark red and the lowest values are given in dark blue. Contours are indicated by solid lines and the values are written along contours. Diets are indicated as points.

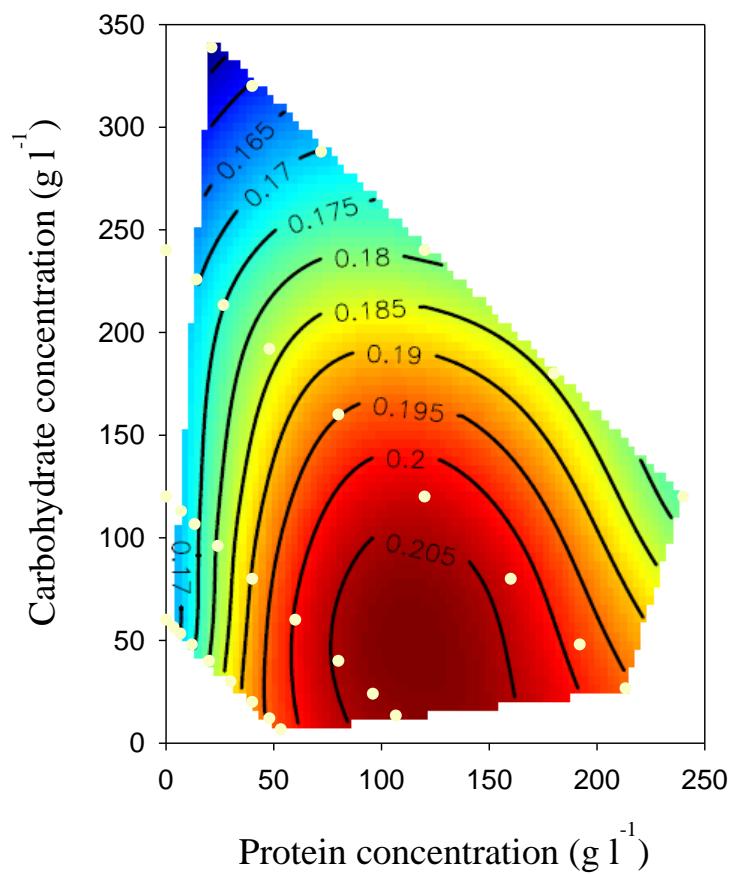

Table S1. Summary of the mean values of measured life-history traits expressed across 34 chemically defined diets.

Dietary composition				Larval life-history traits			Adult life-history traits		
P+C (g l ⁻¹)	P:C	Protein (g l ⁻¹)	CHO (g l ⁻¹)	Egg-to-adult viability (%)	Developmental rate (h ⁻¹)	Body mass (mg)*	Lifespan (day)*	Egg production rate (no. day ⁻¹)	Lifetime fecundity
360	2:1	240	120	62.5	5.108×10^{-3}	0.249	32.1	2.167	51.364
