

Figure S1 – Boxplot representing differences between cool $N = 35$ (blue) and warm $N = 31$ (red) acclimated fish in (A) body mass, (B) fork length, and (C) condition factor as measured at tagging, respirometry and behavioral scoring. Box edges represent the median and 25th and 75th percentiles and whiskers cover the 95th percentiles. Filled circles represent individual data points.

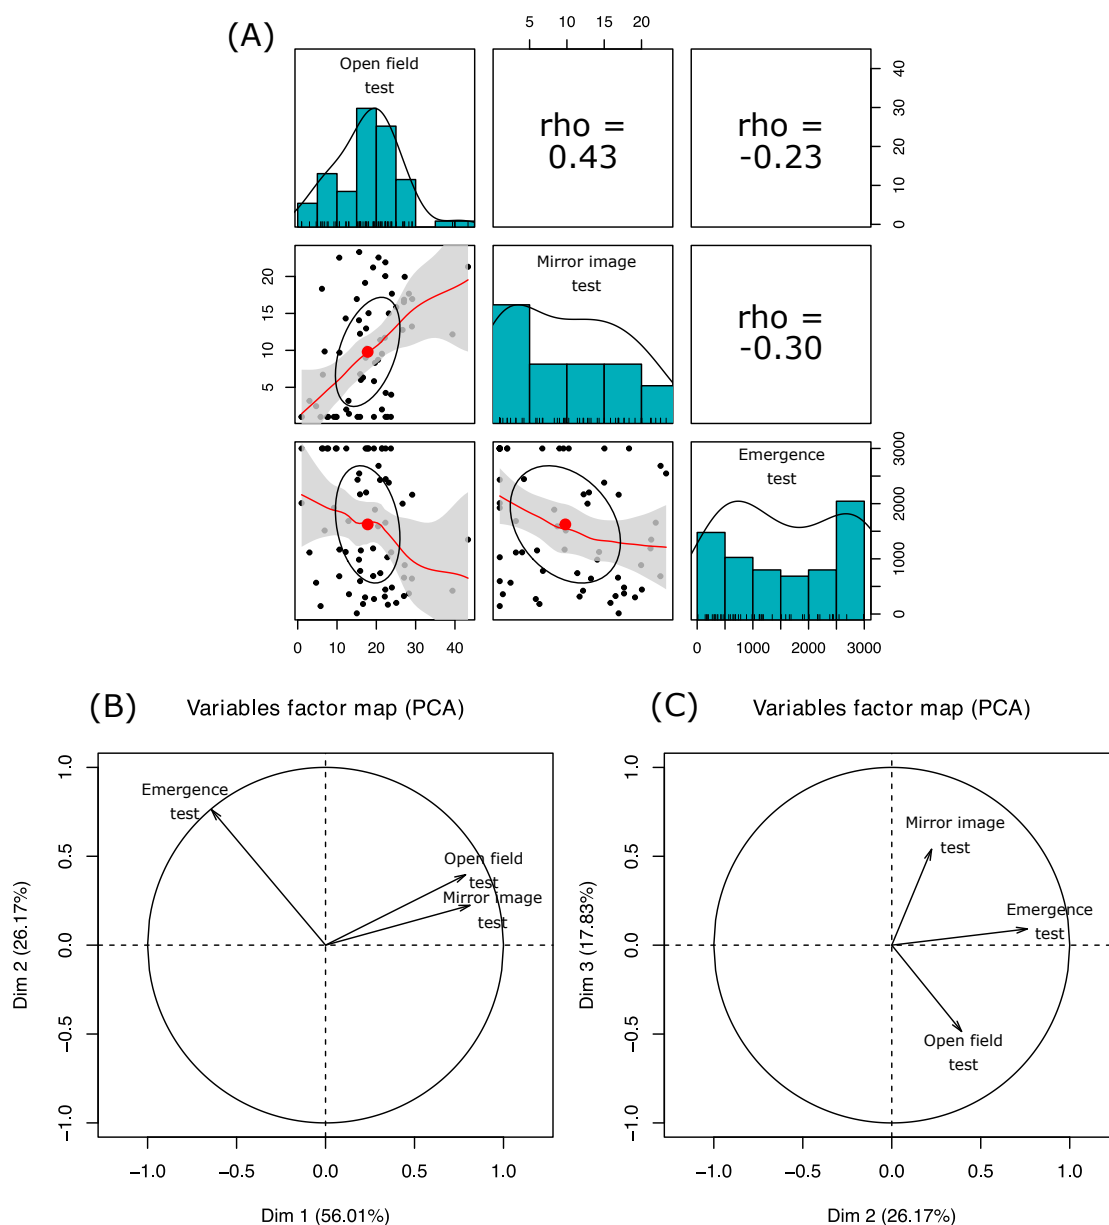

Figure S 2 – (a) Distribution of behavioral traits in individual laboratory tests and their correlations (N = 66). Note that scores of open field test and mirror image test are square-root transformed. Loadings of behavioural traits to the (b) first and second principal components and (c) second and third principal components of PCA.
