Table S2. Statistical results of movement direction in visual contrast experiments. f_D , the frequency of moving towards the darker surface in each setup, excluding those overlapped with contrats edges. G-values are presented with d.f. and P-values in parentheses (*, $P < 0.05$; **, $P < 0.01$; ***, $P < 0.001$). See Fig. 4.

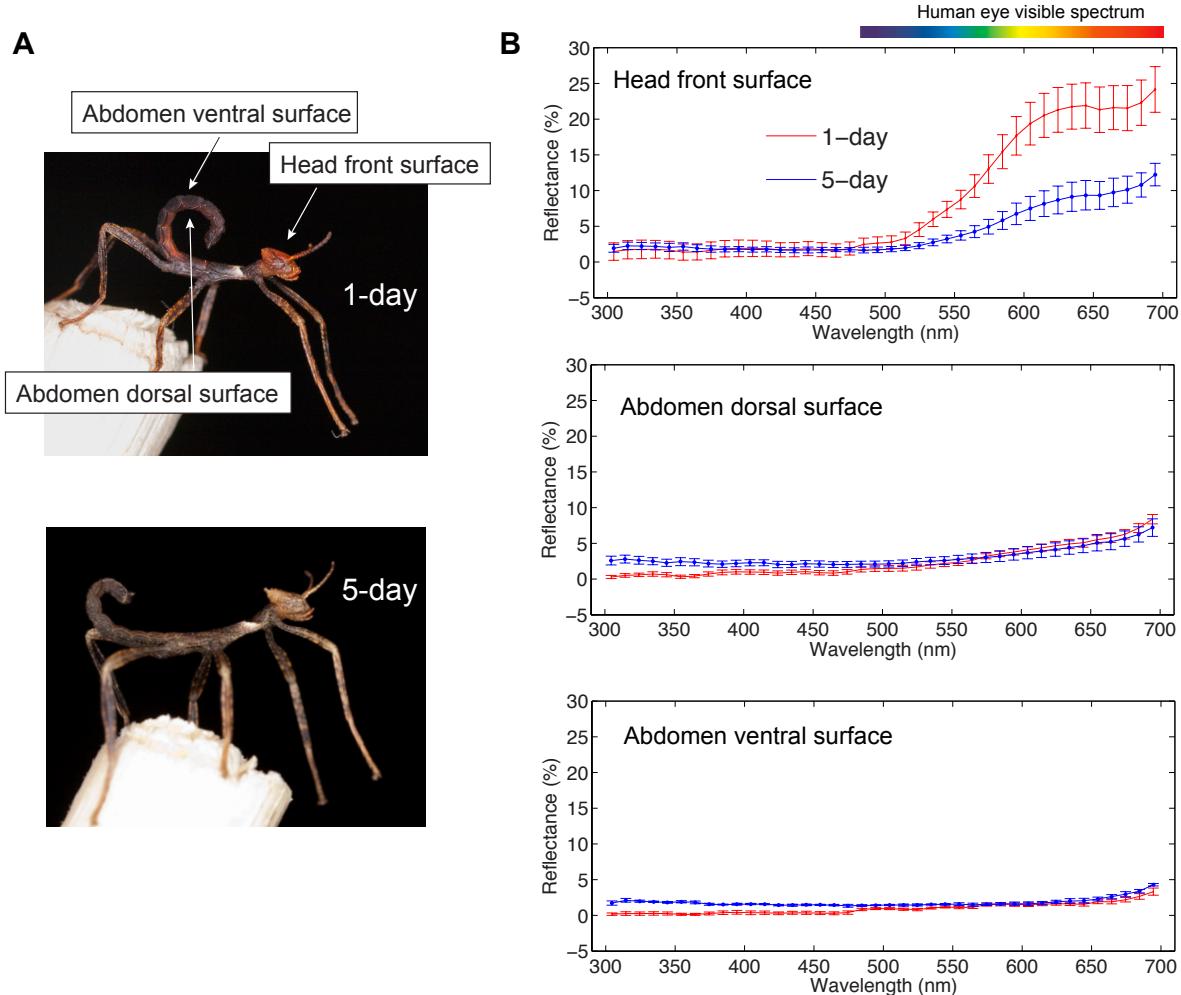

Fig. S1. Ontogenetic loss of ant-mimicry coloration in first instar *E. tiaratum*. (A) Comparison of coloration between a 1-day-old nymph and a 5-day-old nymph. Arrows denote three sampled spots. (B) Comparison of spectral reflectance profiles of three sampled spots between insects of two ages ($N = 5$ individuals per age group), showing the ontogenetic loss of red coloration on head. Spectral reflectance was measured using a spectrophotometer (USB2000, Ocean Optics, Dunedin, FL, USA) with a deuterium-halogen light source (AIS Model MIMI DTA, Analytical Instrument Systems, Flemington, NJ, USA) calibrated with a diffuse white standard (Labsphere Inc., NH, USA). Values are means \pm S.D.
