

Fig. S1. Energy expenditure as a function of work. Energy expenditure, calculated from $\mathrm{VO}_{2}$ and $\mathrm{VCO}_{2}$ using the Weir equation, plotted against workload for a human subject in a graded exercise test reported in Table 3 of Evardsen et al. 2014. The subject maintained a constant running speed ( 4.8 kph ) while the incline of the treadmill increased from $4 \%$ to $20 \%$. Once the treadmill reached $20 \%$, speed was further increased to 5.3 kph and then to 5.8 kph . Workload (Watts) reflects the rate of ascent, speed $\times \sin \theta$, where $\theta$ is treadmill incline angle. The first minute of the test is excluded from this analysis. As can be seen from the plot, energy expenditure continues to track workload above $\mathrm{RER}=1.00$, up to $\mathrm{RER}=1.15$.

Table S2. Tested COL ${ }_{n e t}$ linear mixed effect models. Selected model is bolded.

| Model | $\mathbf{R}^{\mathbf{2}} \mathrm{m}$ | $\mathbf{R}^{2} \mathbf{c}$ | AIC |
| :---: | :---: | :---: | :---: |
| Imer (COL ${ }_{\text {net }} \sim$ velocity + ( $1 \mid$ subject $)$ ) | 0.52 | 0.86 | 187 |
| $\operatorname{lmer}\left(\mathrm{COL}_{\text {net }} \sim \mathrm{tc}^{-1}+(1 \mid\right.$ subject $)$ ) | 0.29 | 0.59 | 232 |
| $\operatorname{lmer}\left(\mathrm{COL}_{\text {net }} \sim\right.$ velocity + mass $+(1 \mid$ subject $)$ ) | 0.53 | 0.86 | 192 |
| $\operatorname{lmer}\left(\mathrm{COL}_{\text {net }} \sim\right.$ velocity $+\mathrm{imi}+(1 \mid$ subject $)$ ) | 0.52 | 0.86 | 180 |
| $\operatorname{lmer}\left(\mathrm{COL}_{\text {net }} \sim\right.$ velocity $+\operatorname{arm}+(1 \mid$ subject $)$ ) | 0.54 | 0.86 | 189 |
| lmer ( $\mathrm{COL}_{\text {net }} \sim$ velocity + height $+(1 \mid$ subject $)$ ) | 0.53 | 0.86 | 192 |
| lmer ( $\mathrm{COL}_{\text {net }} \sim$ velocity + difficulty $+(1 \mid$ subject $)$ ) | 0.54 | 0.86 | 188 |
| $\operatorname{lmer}\left(\right.$ COL $_{\text {net }} \sim$ velocity + experience $+(1 \mid$ subject $)$ ) | 0.51 | 0.86 | 188 |

Table S3. Correlation tests between velocity and potential explanatory variables of COL ${ }_{n e t}$.

| Variable | Type of test | Correlation coefficient | Significance |
| :--- | :--- | :--- | :--- |
| Experience | Spearman's | $\rho=-0.08$ | $\mathrm{p}=0.54$ |
| Difficulty | Spearman's | $\rho=-0.51$ | $\mathbf{p}<\mathbf{0 . 0 1}$ |
| Inverse contact time | Pearson's | $\mathrm{r}=0.73$ | $\mathbf{p}<\mathbf{0 . 0 1}$ |
| Body mass | Spearman's | $\rho=0.05$ | $\mathrm{p}=0.70$ |
| Arm length | Spearman's | $\rho=0.02$ | $\mathrm{p}=0.91$ |
| Height | Spearman's | $\rho<0.01$ | $\mathrm{p}=0.95$ |
| IMI | Spearman's | $\rho=0.29$ | $\mathrm{p}=0.08$ |
