

In this issue i–ii

Huey, R. B. and Eguskitza, X. Limits to human performance: elevated risks on high mountains. 3115–3119

Schoene, R. B. Limits of human lung function at high altitude. 3121–3127

Hornbein, T. F. The high-altitude brain. 3129–3132

Hoppeler, H. and Vogt, M. Muscle tissue adaptations to hypoxia. 3133–3139

Vitzthum, V. J. The home team advantage: reproduction in women indigenous to high altitude. 3141–3150

Rupert, J. L. and Hochachka, P. W. Genetic approaches to understanding human adaptation to altitude in the Andes. 3151–3160

Roach, R. C. and Hackett, P. H. Frontiers of hypoxia research: acute mountain sickness. 3161–3170

Boutilier, R. G. Mechanisms of cell survival in hypoxia and hypothermia. 3171–3181

Westertorp, K. R. Limits to sustainable human metabolic rate. 3183–3187

Conley, K. E., Kemper, W. F. and Crowther, G. J. Limits to sustainable muscle performance: interaction between glycolysis and oxidative phosphorylation. 3189–3194

Lindstedt, S. L. and Conley, K. E. Human aerobic performance: too much ado about limits to \dot{V}_{O_2} . 3195–3199

Fitts, R. H., Riley, D. R. and Widrick, J. J. Functional and structural adaptations of skeletal muscle to microgravity. 3201–3208

Watenpugh, D. E. Fluid volume control during short-term space flight and implications for human performance. 3209–3215

Edgerton, V. R., McCall, G. E., Hodgson, J. A., Gotto, J., Goulet, C., Fleischmann, K. and Roy, R. R. Sensorimotor adaptations to microgravity in humans. 3217–3224

Noakes, T. D., Peltonen, J. E. and Rusko, H. K. Evidence that a central governor regulates exercise performance during acute hypoxia and hyperoxia. 3225–3234

Dudley, R. Limits to human locomotor performance: phylogenetic origins and comparative perspectives. 3235–3240
